## RECENT PROJECTS

**Blog App**                                                                                                   **December 2023**
- A website that presents articles in a simple format, using Markdown to make adding and writing articles easy, with different themes to keep the user engaged. Uses React.js for speed and TypeScript to improve code quality.
- **Technologies:** Typescript, ReactJs, TailwindCSS, Daisyui
- **Links:** ⌗ GitHub Repository  🔗 Live Preview

**Email Services**                                                                                           **November 2023**
- A website It provides the user with a temporary, password-protected, real email that can be accessed at any time via a login page.
- On the new user registration page there is a button to generate a random account and users can also create a manual account.
- Within the website, the email and password are displayed to ensure users don't forget them, and can be copied to a secure location
- **Technologies:** Typescript, ReactJs, NextJs, React-Redux, TailwindCSS, Daisyui
- **Links:** ⌗ GitHub Repository  🔗 Live Preview

**Book Store**                                                                                                   **October 2023**
- In this website I used nodejs and mongodb as the backend with React as the frontend. Anyone can view public books from the front page
- However, to see more details about the book, users must log in
- Users can add new books and also edit or make their books private, preventing others from viewing them or deleting them from the site.
- **Technologies:** Nodejs, Mongodb, ReactJs, React-Redux, TailwindCSS, Daisyui
